Cross site scripting

Severity	High
Reported by module	/Scripts/PerScheme/XSS.script

Description

Cross-site Scripting (XSS) refers to client-side code injection attack wherein an attacker can execute malicious scripts into a legitimate website or web application. XSS occurs when a web application makes use of unvalidated or unencoded user input within the output it generates.

Impact

Malicious JavaScript has access to all the same objects as the rest of the web page, including access to cookies and local storage, which are often used to store session tokens. If an attacker can obtain a user's session cookie, they can then impersonate that user.

Furthermore, JavaScript can read and make arbitrary modifications to the contents of a page being displayed to a user. Therefore, XSS in conjunction with some clever social engineering opens up a lot of possibilities for an attacker.

Recommendation

Apply context-dependent encoding and/or validation to user input rendered on a page

Bitrix open redirect

Severity	Medium
Reported by module	/target/bitrix_audit.js

Description

Acunetix has detected that the web application is based on Bitrix. This version of Bitrix has an open redirect vulnerability.

Open redirection is sometimes used as a part of phishing attacks that confuse visitors about which web site they are visiting.

Impact

A remote attacker can redirect users from your website to a specified URL. This problem may assist an attacker to conduct phishing attacks, spammers.

Recommendation

Upgrade to the latest version of Bitrix

Cookies with missing, inconsistent or contradictory properties

Severity	Low
Reported by module	/RPA/Cookie_Validator.js

Description

At least one of the following cookies properties causes the cookie to be invalid or incompatible with either a different property of the same cookie, of with the environment the cookie is being used in. Although this is not a vulnerability in itself, it will likely lead to unexpected behavior by the application, which in turn may cause secondary security issues.

Impact

Cookies will not be stored, or submitted, by web browsers.

Recommendation

Ensure that the cookies configuration complies with the applicable standards.

Ocookies without HttpOnly flag set

Severity	Low
Reported by module	/RPA/Cookie_Without_HttpOnly.js

Description

One or more cookies don't have the HttpOnly flag set. When a cookie is set with the HttpOnly flag, it instructs the browser that the cookie can only be accessed by the server and not by client-side scripts. This is an important security protection for session cookies.

Impact

Cookies can be accessed by client-side scripts.

Recommendation

If possible, you should set the HttpOnly flag for these cookies.

Cookies without Secure flag set

Severity	Low
Reported by module	/RPA/Cookie_Without_Secure.js

Description

One or more cookies does not have the Secure flag set. When a cookie is set with the Secure flag, it instructs the browser that the cookie can only be accessed over secure SSL/TLS channels. This is an important security protection for session cookies.

Impact

Cookies could be sent over unencrypted channels.

Recommendation

If possible, you should set the Secure flag for these cookies.

Session cookies scoped to parent domain

Severity	Low
Reported by module	/RPA/Cookie_On_Parent_Domain.js

Description

One ore more session cookies are scoped to the parent domain instead of a sub-domain. If a cookie is scoped to a parent domain, then this cookie will be accessible by the parent domain and also by any other sub-domains of the parent domain. This could lead to security problems.

Impact

Recommendation

If possible, the session cookies should be scoped strictly to a sub-domain.

Content Security Policy (CSP) not implemented

Severity	Informational
Reported by module	/httpdata/CSP_not_implemented.js

Description

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.

Content Security Policy (CSP) can be implemented by adding a **Content-Security-Policy** header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:

```
Content-Security-Policy:

default-src 'self';

script-src 'self' https://code.jquery.com;
```

It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.

Impact

CSP can be used to prevent and/or mitigate attacks that involve content/code injection, such as cross-site scripting/XSS attacks, attacks that require embedding a malicious resource, attacks that involve malicious use of iframes, such as clickjacking attacks, and others.

Recommendation

It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the **Content-Security-Policy** HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.

Content type is not specified

Severity Informational

Reported by module /RPA/Content_Type_Missing.js

Description

These page(s) does not set a Content-Type header value. This value informs the browser what kind of data to expect. If this header is missing, the browser may incorrectly handle the data. This could lead to security problems.

Impact

None

Recommendation

Set a Content-Type header value for these page(s).

(i) Email addresses

Severity	Informational
Reported by module	/target/404_text_search.js

Description

One or more email addresses have been found on this website. The majority of spam comes from email addresses harvested off the internet. The spam-bots (also known as email harvesters and email extractors) are programs that scour the internet looking for email addresses on any website they come across. Spambot programs look for strings like myname@mydomain.com and then record any addresses found.

Impact

Email addresses posted on Web sites may attract spam.

Recommendation

Check references for details on how to solve this problem.

(i) File uploads

Severity	Informational
----------	---------------

Reported by module /Crawler/12-Crawler File Upload.js

Description

These pages allows visitors to upload files to the server. Various web applications allow users to upload files (such as pictures, images, sounds, ...). Uploaded files may pose a significant risk if not handled correctly. A remote attacker could send a multipart/form-data POST request with a specially-crafted filename or mime type and execute arbitrary code.

Impact

If the uploaded files are not safely checked an attacker may upload malicious files.

Recommendation

Restrict file types accepted for upload: check the file extension and only allow certain files to be uploaded. Use a whitelist approach instead of a blacklist. Check for double extensions such as .php.png. Check for files without a filename like .htaccess (on ASP.NET, check for configuration files like web.config). Change the permissions on the upload folder so the files within it are not executable. If possible, rename the files that are uploaded.

Outdated JavaScript libraries

Severity	Informational
Reported by module	/httpdata/javascript_library_audit_external.js

Description

You are using an outdated version of one or more JavaScript libraries. A more recent version is available. Although your version was not found to be affected by any security vulnerabilities, it is recommended to keep libraries up to date.

Impact

Consult References for more information.

Recommendation

Upgrade to the latest version.

Password type input with auto-complete enabled

Severity	Informational
Reported by module	/Crawler/12-Crawler_Password_Input_Autocomplete.js

Description

When a new name and password is entered in a form and the form is submitted, the browser asks if the password should be saved. Thereafter when the form is displayed, the name and password are filled in automatically or are completed as the name is entered. An attacker with local access could obtain the cleartext password from the browser cache.

Impact

Possible sensitive information disclosure.

Recommendation

The password auto-complete should be disabled in sensitive applications. To disable auto-complete, you may use a code similar to:

```
<INPUT TYPE="password" AUTOCOMPLETE="off">
```

Affected items

Web Server

Details

Pages with auto-complete password inputs:

Subresource Integrity (SRI) not implemented

Severity	Informational
Reported by module	/RPA/SRI_Not_Implemented.js

Description

Subresource Integrity (SRI) is a security feature that enables browsers to verify that third-party resources they fetch (for example, from a CDN) are delivered without unexpected manipulation. It works by allowing developers to provide a cryptographic hash that a fetched file must match.

Third-party resources (such as scripts and stylesheets) can be manipulated. An attacker that has access or has hacked the hosting CDN can

manipulate or replace the files. SRI allows developers to specify a base64-encoded cryptographic hash of the resource to be loaded. The integrity attribute containing the hash is then added to the <script> HTML element tag. The integrity string consists of a base64-encoded hash, followed by a prefix that depends on the hash algorithm. This prefix can either be sha256, sha384 or sha512.

The script loaded from the external URL specified in the Details section doesn't implement Subresource Integrity (SRI). It's recommended to implement Subresource Integrity (SRI) for all the scripts loaded from external hosts.

Impact

An attacker that has access or has hacked the hosting CDN can manipulate or replace the files.

Recommendation

Use the SRI Hash Generator link (from the References section) to generate a <script> element that implements Subresource Integrity (SRI).

For example, you can use the following <script> element to tell a browser that before executing the https://example.com/example-framework.js script, the browser must first compare the script to the expected hash, and verify that there's a match.

```
<script src="https://example.com/example-framework.js"
integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HNQlGYl1kPzQho1wx4JwY8wC"
crossorigin="anonymous"></script>
```

Scan of consapps.dcr.virginia.gov

Scan details

Scan information		
Start time 2021-08-21T11:49:18.792129-04:00		
Start url https://consapps.dcr.virginia.gov/DSIS/#/		
Host	consapps.dcr.virginia.gov	
Scan time	31 minutes, 42 seconds	
Profile	Full Scan	
Server information	Microsoft-IIS/8.5	
Responsive	True	
Server OS	Windows	
Server technologies	ASP.NET	

Threat level

Acunetix Threat Level 3

One or more high-severity type vulnerabilities have been discovered by the scanner. A malicious user can exploit these vulnerabilities and compromise the backend database and/or deface your website.

Alerts details

TLS 1.0 enabled

Severity	High
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The web server supports encryption through TLS 1.0, which was formally deprecated in March 2021 as a result of inherent security issues. In addition, TLS 1.0 is not considered to be "strong cryptography" as defined and required by the PCI Data Security Standard 3.2(.1) when used to protect sensitive information transferred to or from web sites. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.

Impact

An attacker may be able to exploit this problem to conduct man-in-the-middle attacks and decrypt communications between the affected service and clients.

Recommendation

It is recommended to disable TLS 1.0 and replace it with TLS 1.2 or higher.

References

RFC 8996: Deprecating TLS 1.0 and TLS 1.1 (https://tools.ietf.org/html/rfc8996)

Affected items

Web Server

Details

The SSL server (port: 443) encrypts traffic using TLSv1.0.

Request headers

TLS 1.1 enabled

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The web server supports encryption through TLS 1.1, which was formally deprecated in March 2021 as a result of inherent security issues. When aiming for Payment Card Industry (PCI) Data Security Standard (DSS) compliance, it is recommended to use TLS 1.2 or higher instead. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.

Impact

An attacker may be able to exploit this problem to conduct man-in-the-middle attacks and decrypt communications between the affected service and clients.

Recommendation

It is recommended to disable TLS 1.1 and replace it with TLS 1.2 or higher.

Affected items

Web Server

Details

The SSL server (port: 443) encrypts traffic using TLSv1.1.

Request headers

TLS/SSL LOGJAM attack

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The LOGJAM attack is a SSL/TLS vulnerability that allows attackers to intercept HTTPS connections between vulnerable clients and servers and force them to use 'export-grade' cryptography, which can then be decrypted or altered. This vulnerability alert is issued when a web site is found to support DH(E) export cipher suites, or non-export DHE cipher suites using either DH primes smaller than 1024 bits, or commonly used DH standard primes up to 1024 bits.

Impact

An attacker may intercept HTTPS connections between vulnerable clients and servers.

Recommendation

Reconfigure the affected SSL/TLS server to disable support for any DHE_EXPORT suites, for DH primes smaller than 1024 bits, and for DH standard primes up to 1024 bits. Refer to the "Guide to Deploying Diffie-Hellman for TLS" for further guidance on how to configure affected systems accordingly.

CVE-2015-4000 (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4000)

Affected items

Web Server

Details

Weak DH Key Parameters (p < 1024 bits, or <= 1024 bits for common primes):

- TLS1.2, TLS_DHE_RSA_WITH_AES_256_GCM_SHA384: 1024 bits (common prime)
- TLS1.2, TLS_DHE_RSA_WITH_AES_128_GCM_SHA256: 1024 bits (common prime)

Request headers

TLS/SSL Sweet32 attack

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The Sweet32 attack is a SSL/TLS vulnerability that allows attackers to compromise HTTPS connections using 64-bit block ciphers.

Impact

An attacker may intercept HTTPS connections between vulnerable clients and servers.

Recommendation

Reconfigure the affected SSL/TLS server to disable support for obsolete 64-bit block ciphers.

References

CVE-2016-2183 (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2016-2183)

CVE-2016-6329 (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2016-6329)

Affected items

Web Server

Details

Cipher suites susceptible to Sweet32 attack (TLS1.0 on port 443):

• TLS_RSA_WITH_3DES_EDE_CBC_SHA

Cipher suites susceptible to Sweet32 attack (TLS1.1 on port 443):

· TLS RSA WITH 3DES EDE CBC SHA

Cipher suites susceptible to Sweet32 attack (TLS1.2 on port 443):

· TLS RSA WITH 3DES EDE CBC SHA

Request headers

• TLS/SSL Weak Cipher Suites

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The remote host supports TLS/SSL cipher suites with weak or insecure properties.

Impact

Recommendation

Reconfigure the affected application to avoid use of weak cipher suites.

Connection: Keep-alive
```

ASP.NET version disclosure

Severity	Low
Reported by module	/Scripts/PerServer/ASP_NET_Error_Message.script

Description

The HTTP responses returned by this web application include anheader named **X-AspNet-Version**. The value of this header is used by Visual Studio to determine which version of ASP.NET is in use. It is not necessary for production sites and should be disabled.

Impact

The HTTP header may disclose sensitive information. This information can be used to launch further attacks.

Recommendation

Apply the following changes to the web.config file to prevent ASP.NET version disclosure:

```
<System.Web>
<httpRuntime enableVersionHeader="false" />
</System.Web>
```

References

HttpRuntimeSection.EnableVersionHeader Property (https://docs.microsoft.com/en-us/dotnet/api/system.web.configuration.httpruntimesection.enableversionheader?redirectedfrom=MSDN&view=netframework-4.8#System_Web_Configuration_HttpRuntimeSection_EnableVersionHeader)

Olickjacking: X-Frame-Options header

Severity	Low
Reported by module	/httpdata/X_Frame_Options_not_implemented.js

Description

Clickjacking (User Interface redress attack, UI redress attack, UI redressing) is a malicious technique of tricking a Web user into clicking on something different from what the user perceives they are clicking on, thus potentially revealing confidential information or taking control of their computer while clicking on seemingly innocuous web pages.

The server did not return an **X-Frame-Options** header with the value DENY or SAMEORIGIN, which means that this website could be at risk of a clickjacking attack. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page inside a frame or iframe. Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into untrusted sites.

Impact

The impact depends on the affected web application.

Recommendation

Configure your web server to include an X-Frame-Options header and a CSP header with frame-ancestors directive. Consult Web references for more information about the possible values for this header.

Cross site scripting (content-sniffing)

Severity	Low
Reported by module	/Scripts/PerScheme/XSS.script

Description

This script is possibly vulnerable to Cross Site Scripting (XSS) attacks.

Cross site scripting (also referred to as XSS) is a vulnerability that allows an attacker to send malicious code (usually in the form of Javascript) to another user. Because a browser cannot know if the script should be trusted or not, it will execute the script in the user context allowing the attacker to access any cookies or session tokens retained by the browser.

Impact

Malicious users may inject JavaScript, VBScript, ActiveX, HTML or Flash into a vulnerable application to fool a user in order to gather data from them. An attacker can steal the session cookie and take over the account, impersonating the user. It is also possible to modify the content of the page presented to the user.

Recommendation

Your script should filter metacharacters from user input.

HTTP Strict Transport Security (HSTS) not implemented

Severity

Description

HTTP Strict Transport Security (HSTS) tells a browser that a web site is only accessable using HTTPS. It was detected that your web application doesn't implement HTTP Strict Transport Security (HSTS) as the Strict Transport Security header is missing from the response.

Impact

HSTS can be used to prevent and/or mitigate some types of man-in-the-middle (MitM) attacks

Recommendation

It's recommended to implement HTTP Strict Transport Security (HSTS) into your web application. Consult web references for more information

References

Sensitive pages could be cached

Severity	Low
Reported by module	/RPA/Cacheable_Sensitive_Page.js

Description

One or more pages contain possible sensitive information (e.g. a password parameter) and could be potentially cached. Even in secure SSL channels sensitive data could be stored by intermediary proxies and SSL terminators. To prevent this, a Cache-Control header should be specified.

Impact

Possible sensitive information disclosure.

Recommendation

Prevent caching by adding "Cache Control: No-store" and "Pragma: no-cache" to the HTTP response header.

Affected items

Web Server

Details

List of pages that could be cached:

① Access-Control-Allow-Origin header with wildcard (*) value

Severity	Informational
Reported by module	/httpdata/cors_acao.js

Description

Cross-origin resource sharing (CORS) is a mechanism that allows restricted resources (e.g. fonts) on a web page to be requested from another domain outside the domain from which the resource originated. The Access-Control-Allow-Origin header indicates whether a resource can be shared based on the value of the Origin request header, "*", or "null" in the response.

If a website responds with Access-Control-Allow-Origin: * the requested resource allows sharing with every origin. Therefore, any website can make XHR (XMLHTTPRequest) requests to the site and access the responses.

Impact

Any website can make XHR requests to the site and access the responses.

Recommendation

Check whether Access-Control-Allow-Origin: * is appropriate for the resource/response.

Content Security Policy (CSP) not implemented

Severity	Informational	
Reported by module	/httpdata/CSP_not_implemented.js	

Description

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.

Content Security Policy (CSP) can be implemented by adding a **Content-Security-Policy** header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:

```
Content-Security-Policy:

default-src 'self';

script-src 'self' https://code.jquery.com;
```

It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.

Impact

CSP can be used to prevent and/or mitigate attacks that involve content/code injection, such as cross-site scripting/XSS attacks, attacks that require embedding a malicious resource, attacks that involve malicious use of iframes, such as clickjacking attacks, and others.

Recommendation

It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the **Content-Security-Policy** HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.

Insecure Referrer Policy

Severity	Informational
Reported by module	/httpdata/insecure_referrer_policy.js

Description

Referrer Policy controls behaviour of the Referer header, which indicates the origin or web page URL the request was made from. The web application uses insecure Referrer Policy configuration that may leak user's information to third-party sites.

Impact

In some situations, an attacker may leak a user's private data

Recommendation

Consider setting Referrer-Policy header to 'strict-origin-when-cross-origin' or a stricter value

Microsoft IIS version disclosure

Severity	Informational
Reported by module	/Scripts/PerServer/ASP_NET_Error_Message.script

Description

The HTTP responses returned by this web application include a header named **Server**. The value of this header includes the version of Microsoft IIS server.

Impact

The HTTP header may disclose sensitive information. This information can be used to launch further attacks.

Recommendation

Microsoft IIS should be configured to remove unwanted HTTP response headers from the response. Consult web references for more information.

Outdated JavaScript libraries

Severity	Informational
Reported by module	/httpdata/javascript_library_audit_external.js

Description

You are using an outdated version of one or more JavaScript libraries. A more recent version is available. Although your version was not found to be affected by any security vulnerabilities, it is recommended to keep libraries up to date.

Impact

Consult References for more information.

Recommendation

Upgrade to the latest version.

Subresource Integrity (SRI) not implemented

Severity	Informational
Reported by module	/RPA/SRI_Not_Implemented.js

Description

Subresource Integrity (SRI) is a security feature that enables browsers to verify that third-party resources they fetch (for example, from a CDN) are delivered without unexpected manipulation. It works by allowing developers to provide a cryptographic hash that a fetched file must match.

Third-party resources (such as scripts and stylesheets) can be manipulated. An attacker that has access or has hacked the hosting CDN can manipulate or replace the files. SRI allows developers to specify a base64-encoded cryptographic hash of the resource to be loaded. The integrity attribute containing the hash is then added to the <script> HTML element tag. The integrity string consists of a base64-encoded hash, followed by a prefix that depends on the hash algorithm. This prefix can either be sha256, sha384 or sha512.

The script loaded from the external URL specified in the Details section doesn't implement Subresource Integrity (SRI). It's recommended to implement Subresource Integrity (SRI) for all the scripts loaded from external hosts.

Impact

An attacker that has access or has hacked the hosting CDN can manipulate or replace the files.

Recommendation

Use the SRI Hash Generator link (from the References section) to generate a <script> element that implements Subresource Integrity (SRI).

For example, you can use the following <script> element to tell a browser that before executing the https://example.com/example-framework.js script, the browser must first compare the script to the expected hash, and verify that there's a match.

```
<script src="https://example.com/example-framework.js"
integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HNQlGYl1kPzQho1wx4JwY8wC"
crossorigin="anonymous"></script>
```

1 TLS/SSL (EC)DHE Key Reuse

Severity	Informational
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The remote host reuses Diffie-Hellman Ephemeral public server keys with (EC)DHE cipher suites.

Impact

Recommendation

Reconfigure the affected application to always generate new keys when using tmp dh/tmp ecdh parameters.

Alerts details

TLS 1.0 enabled

Severity	High
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The web server supports encryption through TLS 1.0, which was formally deprecated in March 2021 as a result of inherent security issues. In addition, TLS 1.0 is not considered to be "strong cryptography" as defined and required by the PCI Data Security Standard 3.2(.1) when used to protect sensitive information transferred to or from web sites. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.

Impact

An attacker may be able to exploit this problem to conduct man-in-the-middle attacks and decrypt communications between the affected service and clients.

Recommendation

It is recommended to disable TLS 1.0 and replace it with TLS 1.2 or higher.

Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The web server supports encryption through TLS 1.1, which was formally deprecated in March 2021 as a result of inherent security issues. When aiming for Payment Card Industry (PCI) Data Security Standard (DSS) compliance, it is recommended to use TLS 1.2 or higher instead. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.

Impact

An attacker may be able to exploit this problem to conduct man-in-the-middle attacks and decrypt communications between the affected service and clients.

Recommendation

It is recommended to disable TLS 1.1 and replace it with TLS 1.2 or higher.

Are You Ready for 30 June 2018? Saying Goodbye to SSL/early TLS (https://blog.pcisecuritystandards.org/are-you-ready-for-30-june-2018-saying goodbye-to-ssl-early-tls)

Affected items

Web Server

Details

The SSL server (port: 443) encrypts traffic using TLSv1.1.

Request headers

TLS/SSL LOGJAM attack

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The LOGJAM attack is a SSL/TLS vulnerability that allows attackers to intercept HTTPS connections between vulnerable clients and servers and force them to use 'export-grade' cryptography, which can then be decrypted or altered. This vulnerability alert is issued when a web site is found to support DH(E) export cipher suites, or non-export DHE cipher suites using either DH primes smaller than 1024 bits, or commonly used DH standard primes up to 1024 bits.

Impact

An attacker may intercept HTTPS connections between vulnerable clients and servers.

Recommendation

Reconfigure the affected SSL/TLS server to disable support for any DHE_EXPORT suites, for DH primes smaller than 1024 bits, and for DH standard primes up to 1024 bits. Refer to the "Guide to Deploying Diffie-Hellman for TLS" for further guidance on how to configure affected systems accordingly.

CVE-2015-4000 (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4000)

Affected items

Web Server

Details

Weak DH Key Parameters (p < 1024 bits, or <= 1024 bits for common primes):

- TLS1.2, TLS_DHE_RSA_WITH_AES_256_GCM_SHA384: 1024 bits (common prime)
- TLS1.2, TLS_DHE_RSA_WITH_AES_128_GCM_SHA256: 1024 bits (common prime)

Request headers

TLS/SSL Sweet32 attack

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The Sweet32 attack is a SSL/TLS vulnerability that allows attackers to compromise HTTPS connections using 64-bit block ciphers.

Impact

An attacker may intercept HTTPS connections between vulnerable clients and servers.

Recommendation

Reconfigure the affected SSL/TLS server to disable support for obsolete 64-bit block ciphers.

References

Sweet32: Birthday attacks on 64-bit block ciphers in TLS and OpenVPN (https://sweet32.info/)

CVE-2016-2183 (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2016-2183)

CVE-2016-6329 (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2016-6329)

Affected items

Web Server

Details

Cipher suites susceptible to Sweet32 attack (TLS1.0 on port 443):

• TLS_RSA_WITH_3DES_EDE_CBC_SHA

Cipher suites susceptible to Sweet32 attack (TLS1.1 on port 443):

· TLS RSA WITH 3DES EDE CBC SHA

Cipher suites susceptible to Sweet32 attack (TLS1.2 on port 443):

· TLS RSA WITH 3DES EDE CBC SHA

Request headers

TLS/SSL Weak Cipher Suites

Severity	Medium
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The remote host supports TLS/SSL cipher suites with weak or insecure properties.

Impact

Recommendation

Reconfigure the affected application to avoid use of weak cipher suites.

References

Web Server

Details

Weak TLS/SSL Cipher Suites: (offered via TLS1.0 on port 443):

• TLS_RSA_WITH_3DES_EDE_CBC_SHA (Medium strength encryption algorithm (3DES).)

Weak TLS/SSL Cipher Suites: (offered via TLS1.1 on port 443):

• TLS RSA WITH 3DES EDE CBC SHA (Medium strength encryption algorithm (3DES).)

Weak TLS/SSL Cipher Suites: (offered via TLS1.2 on port 443):

• TLS_RSA_WITH_3DES_EDE_CBC_SHA (Medium strength encryption algorithm (3DES).)

Request headers

① ASP.NET version disclosure

Severity	Low
Reported by module	/Scripts/PerServer/ASP_NET_Error_Message.script

Description

The HTTP responses returned by this web application include anheader named **X-AspNet-Version**. The value of this header is used by Visual Studio to determine which version of ASP.NET is in use. It is not necessary for production sites and should be disabled.

Impact

The HTTP header may disclose sensitive information. This information can be used to launch further attacks.

Recommendation

Apply the following changes to the web.config file to prevent ASP.NET version disclosure:

```
<System.Web>
<httpRuntime enableVersionHeader="false" />
</System.Web>
```

References

HttpRuntimeSection.EnableVersionHeader Property (https://docs.microsoft.com/en-us/dotnet/api/system.web.configuration.httpruntimesection.enableversionheader?redirectedfrom=MSDN&view=netframework-4.8#System Web Configuration HttpRuntimeSection EnableVersionHeader)

Host: consappsrpt.dcr.virginia.gov

Connection: Keep-alive

Olickjacking: X-Frame-Options header

Severity	Low
Reported by module	/httpdata/X_Frame_Options_not_implemented.js

Description

Clickjacking (User Interface redress attack, UI redress attack, UI redressing) is a malicious technique of tricking a Web user into clicking on something different from what the user perceives they are clicking on, thus potentially revealing confidential information or taking control of their computer while clicking on seemingly innocuous web pages.

The server did not return an **X-Frame-Options** header with the value DENY or SAMEORIGIN, which means that this website could be at risk of a clickjacking attack. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page inside a frame or iframe. Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into untrusted sites.

Impact

The impact depends on the affected web application.

Recommendation

Configure your web server to include an X-Frame-Options header and a CSP header with frame-ancestors directive. Consult Web references for more information about the possible values for this header.

O HTTP Strict Transport Security (HSTS) not implemented

Severity	Low
Reported by module	/httpdata/HSTS_not_implemented.js

Description

HTTP Strict Transport Security (HSTS) tells a browser that a web site is only accessable using HTTPS. It was detected that your web application doesn't implement HTTP Strict Transport Security (HSTS) as the Strict Transport Security header is missing from the response.

Impact

HSTS can be used to prevent and/or mitigate some types of man-in-the-middle (MitM) attacks

Recommendation

It's recommended to implement HTTP Strict Transport Security (HSTS) into your web application. Consult web references for more information

References

Ocontent Security Policy (CSP) not implemented

Severity	Informational
Reported by module	/httpdata/CSP_not_implemented.js

Description

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.

Content Security Policy (CSP) can be implemented by adding a **Content-Security-Policy** header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:

```
Content-Security-Policy:

default-src 'self';

script-src 'self' https://code.jquery.com;
```

It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.

Impact

CSP can be used to prevent and/or mitigate attacks that involve content/code injection, such as cross-site scripting/XSS attacks, attacks that require embedding a malicious resource, attacks that involve malicious use of iframes, such as clickjacking attacks, and others.

Recommendation

It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the **Content-Security-Policy** HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.

Insecure Referrer Policy

Severity	Informational
Reported by module	/httpdata/insecure_referrer_policy.js

Description

Referrer Policy controls behaviour of the Referer header, which indicates the origin or web page URL the request was made from. The web application uses insecure Referrer Policy configuration that may leak user's information to third-party sites.

Impact

In some situations, an attacker may leak a user's private data

Recommendation

Consider setting Referrer-Policy header to 'strict-origin-when-cross-origin' or a stricter value

Microsoft IIS version disclosure

Severity	Informational
Reported by module	/Scripts/PerServer/ASP_NET_Error_Message.script

Description

The HTTP responses returned by this web application include a header named **Server**. The value of this header includes the version of Microsoft IIS server.

Impact

The HTTP header may disclose sensitive information. This information can be used to launch further attacks.

Recommendation

Microsoft IIS should be configured to remove unwanted HTTP response headers from the response. Consult web references for more information.

TLS/SSL (EC)DHE Key Reuse

Severity	Informational
Reported by module	/Scripts/PerServer/SSL_Audit.script

Description

The remote host reuses Diffie-Hellman Ephemeral public server keys with (EC)DHE cipher suites.

Impact

Recommendation

Reconfigure the affected application to always generate new keys when using tmp dh/tmp ecdh parameters.
